Abstract

Solving ordinary differential equations (ODEs) with traditional techniques is complicated and time taking task. Traditional techniques of ODE solvers are providing approximate solution. To overcome that drawback and to get exact solution many researchers implemented new techniques which reduces time complexity and gives better solution for given ODE with optimization. In this proposed technique we used generic method of solving ODEs using adaptive differential evolution. Obtained approximate solution is given to improved Fourier periodic expansion function with least square weight method for solving ODEs with optimal solution.

Keywords: Ordinary Differential Equation (ODE), generic method, optimization, Least Square Weight method, Fourier Periodic Expansion Function, intial values.

I. Introduction

Ordinary Differential Equations

The Ordinary Differential Equation (ODE) solvers in MATLAB® solve initial value problems with a variety of properties. The solvers can work on stiff or nonstiff problems, problems with a mass matrix, differential algebraic equations (DAEs), or fully implicit problems.

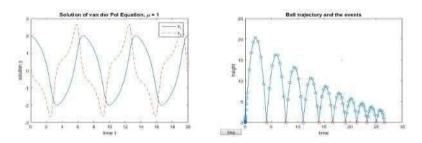

Fig1. Examples for which ODEs need to be solved

Choosing an ODE Solver

An ordinary differential equation (ODE) contains one or more derivatives of a dependent variable, y, with respect to a single independent variable, t, usually referred to as time. The notation used here for representing derivatives of y with respect to x is y' for a first derivative, y'' for a second derivative, and so on. The order of the ODE is equal to the highest-order derivative of y that appears in the equation.

For example, this is a second order ODE:

y'' = 9y

In an initial value problem, the ODE is solved by starting from an initial state. Using the initial condition, y_{μ} , as well as a period of firme over which the answer is to be obtained, (t_{μ}, t_{T}) , the solution is obtained iteratively. At each step the solver applies a particular algorithm to the results of previous steps. At the first such step, the initial condition provides the necessary information that allows the integration to proceed. The final result is that the ODE solver returns a vector of time steps $t = (t_{\mu}, t_{\mu}, t_{\mu}, ..., t_{T})$ as well as the corresponding solution at each step $y = [y_{\mu}, y_{\mu}, y_{\mu},$

Types of ODEs

The ODE solvers in MATLAS® solve these types of first-prose ODEs.

- Explicit ODEs of the form y' = f(x, y)
- Linearly implicit SDEs of the form M (x, y) y = f (x, y), where M (x, y) is a nonshipular mass matrix. The mass matrix can be time- or state-dependent or it can be a constant matrix. Unearly implicit ODEs matrix invariant matrix or the first derivative of y, which are encoded in the mass matrix.
 - Leavily imprice ODEs can always be transformed to an explicit form, $y = M^{-1}(x,y) f(t,y)$. However, specifying the mass matrix straicts to the ODE solver assets the transformation, which is inconvenient and can be computationally expectative.
- If sume components of y are missing, then the equations are called differential algebraic equations, or DAEs, and the system of DAEs contains some algebraic variables. Algebraic variables are dependent variables whose definitions or not appear or the equations. All system of DAEs can be regardless as an equation of order order DEs by tables
 Order order or the equations to elementary and the expension of the equation of the equation
- Fully impairs ODEs of this form if (x, y, y') = 0. Fully implicit ODEs cannot be rewritten in an explicit form, and implicit also contain some eligibilities regulation. Phil select 1 infrarers assigned for fully implicit problems, including extend 1 BAEs.

You can supply additional information to the solver for some types of problems by using the solvent function to create an options structure.

Basic Solver Selection for ODEs in MATLAB

ODE45 performs well with most ODE problems and should generally be your first choice of solver. However, ODE23, ODE78, ODE89 and ODE113 can be more efficient than ode45 for problems with looser or tighter accuracy requirements. Some ODE problems exhibit stiffness, or difficulty in evaluation. Stiffness is a term that defies a precise definition, but in general, stiffness occurs when there is a difference in scaling somewhere in the problem.

For example, if an ODE has two solution components that vary on drastically different time scales, then the equation might be stiff. You can identify a problem as stiff if nonstiff solvers (such as ode45) are unable to solve the problem or are extremely slow. If you observe that a nonstiff solver is very slow, try using a stiff solver such as ODE15s instead. When using a stiff solver, you can improve reliability and efficiency by supplying the Jacobian matrix or its sparsity pattern.

Below table provides general guidelines on when to use each of the different solvers.

wis355.	Soft	Cox to Medium	Try valents when occess take as as inefficient and you acquest that the problem is stiff. Also use peeds is when solving differential algebraic equations (SAEs).
###235.		Love	ode 2's can be more efficient than ode 5's at problems with crude error tolerances. It can solve occur off! problems for which usess is not effective.
			ode235 computes the Jacobian in each step, so it is terminal to provide the Jacobian vio edeant to maintain offstoncy and accuracy.
			(Privere is a missis matrix, if roust be constant.
odsžít		Arme	Use ode221 if the problem to only make also still and you need a solution without numerical damping.
			wsx27t can solve (Ifferential algebraic equations (ISAts).
edezitio		toe	Like elects, the coloratio solver might be more efficient than elects at problems with crude even tolerances.
edsth)	Fully incplical	Low	Use odes it is tally implicit problems $f(x,y')$ = x and for differential algebraic equations-(DAEs) of exists x .
Solver	Problem Type	Accuracy	When to Use
odet5	Hansiff	Medium	Most of the time, exists should be the first valver you try.
ods23		Ecel	ode23 can be more efficient than ode45 at problems with crude solerances, or in the gressence of moderate stiffness.
adeSSS		Low to High	which is on the more efficient than each of problems with straggers aren tolerances, or when the ODE function is expensive to evaluate.
nde78		High	vice 78 can be more efficient than ed-45 at problems with emooth solutions that have high accuracy requirements.
adell9		High	note(F) can be more efficient than one 76 on very annoth problems, when integrating over long time intervals, or
			when tolerances are especially light.

This table contains a list of the available ODE and DAE example files as well as the solvers and options they use in MATLAB.

II. Literature Survey for ODEs Solving

Differential equations can describe nearly all systems undergoing change. They are ubiquitous is science and engineering as well as economics, social science, biology, business, health care, etc. Many researchers and mathematicians have studied the nature of Differential Equations and many complicated systems that can be described quite precisely with mathematical expressions.

There are basic 2 types of differential equations as,

Ordinary differential equations		Partial differential equations	
Class 1	Class 2	Class 3	
$\frac{dy}{dx} = f(x)$	$\frac{dy}{dx} = f(x, y)$	$x\frac{\partial u}{\partial x} + y\frac{\partial u}{\partial y} = u$	

Swiss mathematicians, brothers Jacob Bernoulli (1654-1705) and Johann Bernoulli (1667-1748), in Basel, Switzerland, were among the first interpreters of Leibniz' version of differential calculus. They were both critical of Newton's theories and maintained that Newton's theory of

fluxions was plagiarized from Leibniz' original theories, and went to great lengths, using differential calculus, to disprove Newton's Principia, on account that the brothers could not accept the theory, which Newton had proven, that the earth and the planets rotate around the sun in elliptical orbits. [3]

The first book on the subject of differential equations, supposedly, was Italian mathematician Gabriele Manfredi's 1707 On the Construction of First-degree Differential Equations, written between 1701 and 1704, published in Latin. [4] The book was largely based or themed on the views of the Leibniz and the Bernoulli brothers. Most of the publications on differential equations and partial differential equations, in the years to follow, in the 18th century, seemed to expand on the version developed by Leibniz, a methodology, employed by those as Leonhard Euler, Daniel Bernoulli, Joseph Lagrange, and Pierre Laplace.

In 1739, Swiss mathematician Leonhard Euler began using the integrating factor as an aid to derive differential equations that were integrable in finite form [5] The circa 1828 work of English physical mathematician George Green seems to have something to do with defining a test for an "integrable" or conservative field of force (or somehow has connection to thermodynamics via William Thomson); such as in terms of the later 1871 restylized "curl" notation (test of integrability) of James Maxwell (or possibly the earlier work of Peter Tait). [10]

III. Proposed Methodology

Generic Method:

1.1 Improved Fourier Periodic Expansion Function

This immediately gives any poefficient s_k of the trigonometrical series for $\varphi(y)$ for any function which has such an expansion. It works because if φ has such an expansion, then (under suitable convergence assumptions) the integral $a_k = \int_{-1}^1 \varphi(y) \cos(2k+1) \frac{\pi y}{2} \, dy$ $= \int_{-1}^1 \left(a \cos \frac{\pi y}{2} \cos(2k+1) \frac{\pi y}{2} + a^* \cos 3 \frac{\pi y}{2} \cos(2k+1) \frac{\pi y}{2} + \cdots \right) \, dy$

1.2 Least Square Weight Method

The method of ordinary least squares assumes that there is constant variance in the errors (which is called homoscedasticity). The method of weighted least squares can be used when the ordinary least squares assumption of constant variance in the errors is violated (which is called heteroscedasticity).

Advantages of proposed Technique

Nearly exact solution

Less time Complexity

Applications of Proposed Technique

- science and engineering
- economics,
- social science,
- biology,
- business,
- health care, etc

IV. Result Analysis

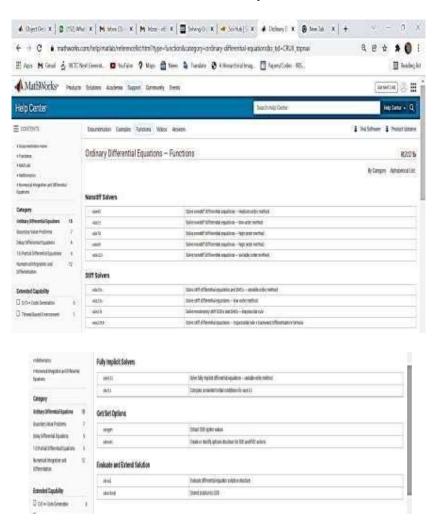

Fig 4.1. Functions available in matlab for Solving Ordinary Differential Equation

For solving differential equation matlab needs 3 steps as,

Step1: initialising condition for Matlab ODE solver

Step2: Solving system equation using Matlab tools

Step3: Getting optimal solution and plotting

Example:

Output

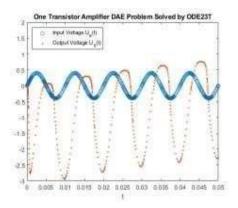

Fig. 4.2 Output of ODE23T DAE solution

V. Conclusion

With the help of proposed technique ODEs are solved with optimal solution. In proposed technique we used combination of two techniques as improved Fourier periodic expansion function and least square weight method.
