

## MAXIMAL INCIDENCE EDGE PRIME GRAPHS

Dr. Sunoj B S

Associate Professor, Department of Mathematics , Government Polytechnic College, Attingal

**ABSTRACT** . In this paper I introduce a new labeling. I prove that some tree graphs are maximal incidence edge prime graphs. Further I prove sum of the edge values is equal to sum of the vertex values.

### 1. INTRODUCTION

I consider simple finite and undirected graphs. For all terminology and notations I follow Harary[2]. First I provide some definitions useful for present work.

**Definition 1.1** Star graph is a special type of graph in which  $n$  vertices have degree one and a single vertex have degree  $n$ . This graph is denoted by the symbol  $K_{1,n}$ .

**Definition 1.2** Graph obtained by adding single pendant edge to each vertex of a path  $P_n$  is called comb graph and is denoted by  $P_n \odot K_1$ .

**Definition 1.3** Graph obtained by adding two pendant edges to each vertex of path  $P_n$  is called centipede graph and is denoted by  $P_n \odot K_{1,2}$ .

**Definition 1.4** Graph obtained by adding two pendant edges to each internal vertex of path  $P_n$  is called twig graph and is denoted by  $T_w(n)$ .

**Definition 1.5** Bi star  $B(n,n)$  is the graph obtained by joining the apex vertices of two copies of  $K_{1,n}$  by an edge.

**Definition 1.6** A Coconut Tree  $CT(m, n)$  is the graph obtained from the path  $P_n$  by appending  $m$  new pendent edges at an end vertex of  $P_n$ .

**Definition 1.7** A graph obtained from a given graph by breaking up each edge into two edges by inserting a vertex between its two ends is called sub division graph.

**Definition 1.8** Greatest common incidence number (gcin) of a vertex of degree two or more is the greatest common divisor of the labels of the edges incident on that vertex.

**Definition 1.9** A labeled graph is said to be an incidence edge prime graph, if the gcin of all vertices of degree greater than one is one.

**Definition 1.10** A labeled graph is said to be a maximal incidence edge prime graph, if the edge label is the maximum of the end vertex labels.

### 2. MAIN RESULTS

**Theorem 2.1** Path  $P_n$  is a maximal incidence edge prime graph.

**Proof:** Let  $a_1, a_2, \dots, a_n$  be the vertices of the path. Then  $|V(P_n)| = n$  and  $|E(P_n)| = n-1$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, n-1\}$  which labels the vertices by

$$f(a_i) = i-1 \text{ for all } i \text{ from } 1 \text{ to } n.$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, n-1\}$  which labels the edges by

$$f^*(a_i a_{i+1}) = \text{Max of } \{f(a_i), f(a_{i+1})\}$$

$$\begin{aligned}
 &= \text{Max of } \{i-1, i\} \\
 &= i, \text{ for all } i \text{ from } 1 \text{ to } n-1. \\
 \text{gcin of } (a_{i+1}) &= \text{gcd of } \{f^*(a_i a_{i+1}), f^*(a_{i+1} a_{i+2})\} \\
 &= \text{gcd of } \{i, i+1\} \\
 &= 1, \text{ for all } i \text{ from } 1 \text{ to } n-2.
 \end{aligned}$$

Hence path  $P_n$  is a maximal incidence edge prime graph.

Example 2.1 Maximal incidence edge prime labeling of path  $P_5$  is shown in Figure 1.

Figure 1

Theorem 2.2 Star graph  $K_{1,n}$  is a maximal incidence edge prime graph.

Proof: Let  $a, a_1, a_2, \dots, a_n$  be the vertices of the graph. Then  $|V(K_{1,n})| = n+1$  and  $|E(K_{1,n})| = n$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, n\}$  which labels the vertices by

$$\begin{aligned}
 f(a_i) &= i \text{ for all } i \text{ from } 1 \text{ to } n. \\
 f(a) &= 0.
 \end{aligned}$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, n\}$  which labels the edges by

$$\begin{aligned}
 f^*(aa_i) &= \text{Max of } \{f(a), f(a_i)\} \\
 &= \text{Max of } \{0, i\} \\
 &= i \text{ for all } i \text{ from } 1 \text{ to } n.
 \end{aligned}$$

$$\begin{aligned}
 \text{gcin of } (a) &= \text{gcd of } \{f^*(aa_1), f^*(aa_2)\} \\
 &= \text{gcd of } \{1, 2\} \\
 &= 1.
 \end{aligned}$$

Hence  $K_{1,n}$  is a maximal incidence edge prime graph.

Example 2.2 Maximal incidence edge prime labeling of  $K_{1,4}$  is shown in Figure 2.

Figure 2

Theorem 2.3 Comb graph  $P_n \odot K_1$  is a maximal incidence edge prime graph.

Proof: Let  $a_1, a_2, \dots, a_n, b_1, b_2, \dots, b_n$  be the vertices of the graph. Then  $|V(P_n \odot K_1)| = 2n$  and  $|E(P_n \odot K_1)| = 2n-1$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, 2n-1\}$  which labels the vertices by

$$f(a_i) = 2i-2 \text{ for all } i \text{ from } 1 \text{ to } n.$$

$$f(b_i) = 2i-1 \text{ for all } i \text{ from } 1 \text{ to } n.$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, 2n-1\}$  which labels the edges by

$$\begin{aligned} f^*(a_i a_{i+1}) &= \text{Max of } \{f(a_i), f(a_{i+1})\} \\ &= \text{Max of } \{2i-2, 2i\} \\ &= 2i, \text{ for all } i \text{ from } 1 \text{ to } n-1. \end{aligned}$$

$$\begin{aligned} f^*(a_i b_i) &= \text{Max of } \{f(a_i), f(b_i)\} \\ &= \text{Max of } \{2i-2, 2i-1\} \\ &= 2i-1, \text{ for all } i \text{ from } 1 \text{ to } n. \end{aligned}$$

$$\begin{aligned} \text{gcin of } (a_1) &= \text{gcd of } \{f^*(a_1 b_1), f^*(a_1 a_2)\} \\ &= \text{gcd of } \{1, 2\} \\ &= 1. \end{aligned}$$

$$\begin{aligned} \text{gcin of } (a_{i+1}) &= \text{gcd of } \{f^*(a_i a_{i+1}), f^*(a_{i+1} b_{i+1})\} \\ &= \text{gcd of } \{2i, 2i+1\} \\ &= 1, \text{ for all } i \text{ from } 1 \text{ to } n-1. \end{aligned}$$

Hence  $K_{1,n}$  is a maximal incidence edge prime graph.

Example 2.3 Maximal incidence edge prime labeling of  $P_5 \odot K_1$  is shown in Figure 3

Figure 3

Theorem 2.4 Centipede graph  $P_n \odot K_{1,2}$  is a maximal incidence edge prime graph.

Proof: Let  $a_1, a_2, \dots, a_n, b_1, b_2, \dots, b_n, c_1, c_2, \dots, c_n$  be the vertices of the graph.

Then  $|V(P_n \odot K_{1,2})| = 3n$  and  $|E(P_n \odot K_{1,2})| = 3n-1$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, 3n-1\}$  which labels the vertices by

$$f(a_i) = 3i-2 \text{ for all } i \text{ from } 1 \text{ to } n.$$

$$f(b_i) = 3i-3 \text{ for all } i \text{ from } 1 \text{ to } n.$$

$$f(c_i) = 3i-1 \text{ for all } i \text{ from } 1 \text{ to } n.$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, 3n-1\}$  which labels the edges by

$$\begin{aligned} f^*(b_i b_{i+1}) &= \text{Max of } \{f(b_i), f(b_{i+1})\} \\ &= \text{Max of } \{3i-3, 3i\} \\ &= 3i, \text{ for all } i \text{ from } 1 \text{ to } n-1. \end{aligned}$$

$$\begin{aligned} f^*(a_i b_i) &= \text{Max of } \{f(a_i), f(b_i)\} \\ &= \text{Max of } \{3i-2, 3i-3\} \\ &= 3i-2, \text{ for all } i \text{ from } 1 \text{ to } n. \end{aligned}$$

$$\begin{aligned} f^*(b_i c_i) &= \text{Max of } \{f(b_i), f(c_i)\} \\ &= \text{Max of } \{3i-3, 3i-1\} \\ &= 3i-1, \text{ for all } i \text{ from } 1 \text{ to } n. \end{aligned}$$

$$\begin{aligned} \text{gcd of } (b_i) &= \text{gcd of } \{f^*(a_i b_i), f^*(b_i c_i)\} \\ &= \text{gcd of } \{3i-2, 3i-1\} \\ &= 1, \text{ for all } i \text{ from } 1 \text{ to } n. \end{aligned}$$

Hence  $P_n \odot K_{1,2}$  is a maximal incidence edge prime graph.

Example 2.4 Maximal incidence edge prime labeling of  $P_4 \odot K_{1,2}$  is shown in Figure 4.

Figure 4.

Theorem 2.5 Coconut tree graph  $CT(m, n)$  is a maximal incidence edge prime graph.

Proof: Let  $a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_n$  be the vertices of the graph.

Then  $|V(CT(m, n))| = m+n$  and  $|E(CT(m, n))| = m+n-1$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, m+n-1\}$  which labels the vertices by

$$\begin{aligned} f(a_i) &= i-1 \text{ for all } i \text{ from } 1 \text{ to } m. \\ f(b_i) &= m+i-1 \text{ for all } i \text{ from } 1 \text{ to } n. \end{aligned}$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, m+n-1\}$  which labels the edges by

$$\begin{aligned} f^*(a_i a_{i+1}) &= \text{Max of } \{f(a_i), f(a_{i+1})\} \\ &= \text{Max of } \{i-1, i\} \\ &= i, \text{ for all } i \text{ from } 1 \text{ to } m-1. \end{aligned}$$

$$\begin{aligned}
 f^*(a_mb_i) &= \text{Max of } \{f(a_m), f(b_i)\} \\
 &= \text{Max of } \{m-1, m+i-1\} \\
 &= m+i-1, \text{ for all } i \text{ from } 1 \text{ to } n. \\
 \text{gcin of } (a_m) &= \text{gcd of } \{f^*(a_{m-1}a_m), f^*(a_mb_1)\} \\
 &= \text{gcd of } \{m-1, m\} \\
 &= 1. \\
 \text{gcin of } (a_{i+1}) &= \text{gcd of } \{f^*(a_ia_{i+1}), f^*(a_{i+1}a_{i+2})\} \\
 &= \text{gcd of } \{i, i+1\} \\
 &= 1, \text{ for all } i \text{ from } 1 \text{ to } m-2.
 \end{aligned}$$

Hence CT(m,n) is a maximal incidence edge prime graph.

Example 2.5 Maximal incidence edge prime labeling of CT(5,4) is shown in Figure 5.

Figure 5.

Theorem 2.6 Bi star graph B(m,n) is a maximal incidence edge prime graph.

Proof: Let x,y,a<sub>1</sub>,a<sub>2</sub>,...,a<sub>m</sub>, b<sub>1</sub>,b<sub>2</sub>,...,b<sub>n</sub> be the vertices of the graph. Then |V(B(m,n))| = m+n+2 and

$$|E(B(m,n))| = m+n+1.$$

I define a function  $f : V \rightarrow \{0,1,\dots,m+n+1\}$  which labels the vertices by

$$\begin{aligned}
 f(x) &= 0. \\
 f(y) &= 1. \\
 f(a_i) &= i+1 \text{ for all } i \text{ from } 1 \text{ to } m. \\
 f(b_i) &= m+i+1 \text{ for all } i \text{ from } 1 \text{ to } n.
 \end{aligned}$$

I define a function  $f^* : E \rightarrow \{1,2,\dots,m+n+1\}$  which labels the edges by

$$\begin{aligned}
 f^*(xa_i) &= \text{max of } \{f(x), f(a_i)\} \\
 &= \text{max of } \{0, i+1\} \\
 &= i+1, \text{ for all } i \text{ from } 1 \text{ to } m. \\
 f^*(yb_i) &= \text{max of } \{f(y), f(b_i)\} \\
 &= \text{max of } \{1, m+i+1\} \\
 &= m+i+1, \text{ for all } i \text{ from } 1 \text{ to } n. \\
 f(xy) &= 1.
 \end{aligned}$$

$$\begin{aligned} \text{gcin of } (x) &= \text{gcd of } \{f^*(xa_1), f^*(xa_2)\} \\ &= \text{gcd of } \{2, 3\} \\ &= 1. \\ \text{gcin of } (y) &= \text{gcd of } \{f^*(yb_1), f^*(yb_2)\} \\ &= \text{gcd of } \{m+2, m+3\} \\ &= 1. \end{aligned}$$

Hence  $B(m,n)$  is a maximal incidence edge prime graph.

Example 2.6 Maximal incidence edge prime labeling of  $B(3,4)$  is shown in Figure 6.

Figure 6

Theorem 2.7 Subdivision graph of star  $K_{1,n}(Sd(K_{1,n}))$  is a maximal incidence edge prime graph.

Proof: Let  $x, a_1, a_2, \dots, a_n, b_1, b_2, \dots, b_n$  be the vertices of the graph. Then  $|V(Sd(K_{1,n}))| = 2n+1$  and  $|E(Sd(K_{1,n}))| = 2n$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, 2n\}$  which labels the vertices by

$$\begin{aligned} f(x) &= 0. \\ f(a_i) &= 2i-1 \text{ for all } i \text{ from } 1 \text{ to } n. \\ f(b_i) &= 2i \text{ for all } i \text{ from } 1 \text{ to } n. \end{aligned}$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, 2n\}$  which labels the edges by

$$\begin{aligned} f^*(xa_i) &= \text{Max of } \{f(x), f(a_i)\} \\ &= \text{Max of } \{0, 2i-1\} \\ &= 2i-1, \text{ for all } i \text{ from } 1 \text{ to } n. \\ f^*(a_i b_i) &= \text{Max of } \{f(a_i), f(b_i)\} \\ &= \text{Max of } \{2i-1, 2i\} \\ &= 2i, \text{ for all } i \text{ from } 1 \text{ to } n. \\ \text{gcin of } (a_i) &= \text{gcd of } \{f^*(xa_i), f^*(a_i b_i)\} \\ &= \text{gcd of } \{2i-1, 2i\} \\ &= 1, \text{ for all } i \text{ from } 1 \text{ to } n. \\ \text{gcin of } (x) &= \text{gcd of } \{f^*(xa_1), f^*(xa_2)\} \\ &= \text{gcd of } \{1, 3\} \\ &= 1. \end{aligned}$$

Hence  $Sd(K_{1,n})$  is a maximal incidence edge prime graph.

Example 2.7 Maximal incidence edge prime labeling of  $Sd(K_{1,4})$  is shown in Figure 7.

Figure 7.

Theorem 2.8 Twig graph  $T_w(n)$  is a maximal incidence edge prime graph.

Proof: Let  $a_1, a_2, \dots, a_n, b_1, b_2, \dots, b_{n-2}, c_1, c_2, \dots, c_{n-2}$  be the vertices of the graph.

Then  $|V(T_w(n))| = 3n-4$  and  $|E(T_w(n))| = 3n-5$ .

I define a function  $f: V \rightarrow \{0, 1, \dots, 3n-5\}$  which labels the vertices by

$$f(a_i) = i-1 \text{ for all } i \text{ from } 1 \text{ to } n.$$

$$f(b_i) = n+i-1, \text{ for all } i \text{ from } 1 \text{ to } n-2.$$

$$f(c_i) = 2n-3+i, \text{ for all } i \text{ from } 1 \text{ to } n-2.$$

I define a function  $f^*: E \rightarrow \{1, 2, \dots, 3n-5\}$  which labels the edges by

$$\begin{aligned} f^*(a_i a_{i+1}) &= \text{Max of } \{f(a_i), f(a_{i+1})\} \\ &= \text{Max of } \{i-1, i\} \\ &= i, \text{ for all } i \text{ from } 1 \text{ to } n-1. \end{aligned}$$

$$\begin{aligned} f^*(a_{i+1} b_i) &= \text{Max of } \{f(a_{i+1}), f(b_i)\} \\ &= \text{Max of } \{i, n+i-1\} \\ &= n+i-1, \text{ for all } i \text{ from } 1 \text{ to } n-2. \end{aligned}$$

$$\begin{aligned} f^*(a_{i+1} c_i) &= \text{Max of } \{f(a_{i+1}), f(c_i)\} \\ &= \text{Max of } \{i, 2n-3+i\} \\ &= 2n-3+i, \text{ for all } i \text{ from } 1 \text{ to } n-2. \end{aligned}$$

$$\begin{aligned} \text{gcd of } (a_{i+1}) &= \text{gcd of } \{f^*(a_i a_{i+1}), f^*(a_{i+1} a_{i+2})\} \\ &= \text{gcd of } \{i, i+1\} \\ &= 1, \text{ for all } i \text{ from } 1 \text{ to } n-2. \end{aligned}$$

Hence  $T_w(n)$  is a maximal incidence edge prime graph.

Theorem 2.9 Sum of the edge values is equal to sum of the vertex values in a circuit less maximal incidence prime graph.

Proof : Let  $G$  be the graph with  $n$  vertices. Since  $G$  is a tree, it has only  $n-1$  edges. Labels of the vertices are  $0, 1, \dots, n-1$  and the labels of the edges are  $1, 2, \dots, n$ . Hence the theorem.

Example 2.8 Maximal incidence edge prime labeling of  $T_w(5)$  is shown in Figure 8.

Figure 8.

### 3. CONCLUSION

In this paper I introduced a new labeling and proved that some connected circuit less graphs are maximal incidence edge prime graphs. Further I proved a general theorem on connected circuit less maximal incidence prime graphs. To explore some new maximal incidence edge prime graphs is an open problem
